# Technical Administration

This document provides technical information and instructions for technical administrators, such as developers and engineers.

## Integration Process Overview

An overview of the punchout process is as follows:

- 1) Customer selects Amazon in their purchasing system.
- 2) Customer purchasing system does a synchronous web post to the Amazon purchasing page, supplying the cXML containing required fields.
- 3) Amazon validates credentials, saves the shopping-cart-import URL, and responds synchronously to the web post, supplying the shopping cart entry URL.
- 4) Customer purchasing system navigates the client (using a new browser window) to Amazon.
- 5) The user builds a shopping cart within Amazon and selects the “submit requisition” (check out) option.
- 6) Amazon posts the cart cXML synchronously to the Customer purchasing system shopping-cart-import URL (from step 3 above).
- 7) Customer purchasing system processes the cart cXML, creating or appending to a requisition for the user.
- 8) Customer purchasing system responds synchronously to the web post with success or failure.
- 9) Amazon displays an appropriate message to the user.
- 10) The user returns to the customer purchasing system, where their requisition can be viewed, modified, deleted, or submitted for approval and purchase order creation.
- 11) Amazon receives the purchase order from customer purchasing as a cXML order.
- 12) Purchase order is validated by Amazon.
- 13) Order confirmation is sent via email to the buyer and the payer on the business account. *Optionally*, an order confirmation cXML can be sent to the purchasing system.
- 14) At the same time, Shipment confirmation is sent via email to the buyer and the payer on the business account. *Optionally*, an order confirmation cXML can be sent to the purchasing system.

## Account Setup and Configuration

In order to use Amazon PunchOut, the administrator must have an Amazon business account and register the business, and the business must be connected with a purchasing system that

can integrate with Amazon. After registration is complete, the business automatically enters verification.

After the business has been verified, the purchasing system integration settings can be completed for the business by either the Amazon Customer Integrations team or self-service in Manage Your Business under Your Account on Amazon.

For shipping address, the purchasing system relies solely on the shipping address provided in the order request cXML.

Note that the primary account administrator would, by default, receive email notifications on any purchase made through the account, as well as various status notification emails. If the customer expects the order volume to be high, they can designate a generic primary account email to receive these requests.

Payment methods are not setup during the technical administration. Payment methods are set up by the administrator in the management pages of the business account.

Amazon does not support cXML-invoicing at this time.

## Registration for Purchasing System Integration

To register with Amazon PunchOut, the customer needs to set up the account settings via the purchasing settings link in the business account management console. The setup process generates the cXML-based credentials used to punchout.

Amazon provides the URL address to be used to send messages to Amazon from the customer. The customer is required to provide the URL address for messages sent from Amazon such as order confirmation and shipment confirmation.

After the purchasing system is integrated with Amazon, the business system is placed in Test mode, where the Administrator can test the system. While in Test mode, the business is not charged, and orders are not fulfilled.

Administrators can punchout to Amazon, shop, add items to the Cart, and select the Submit for approval button.

After testing is complete, the Administrator can change (edit) the status to Active mode in the management console. After the administrator edits to active, they need to add a payment

method before an order can be placed. Payment methods are added in the management console.

## Technical Information Exchange

The following is an example of technical information that is exchanged between your company purchasing system and Amazon.

Image 1.3 Amazon-supported message transactions

Amazon-supported message transactions	
	cXML PunchoutSetupRequest
	cXML PunchoutSetupResponse
	cXML PunchoutOrderMessage
	cXML OrderRequest
	cXML OrderConfirmation
	cXML ShipmentConfirmation
<b>Business partner purchasing platform</b>	purchasing System
Amazon Business Partner Production Environment Setup	
<b>*This information is sent to the Technical Administrator in an email.</b>	
Punchout setup request URL	<a href="https://www.amazon.com/purchasing/punchout">https://www.amazon.com/purchasing/punchout</a>
Punch-Out cXML From Credentials/UserName	Your company
Punchout cXML To credentials	Amazon
Punchout cXML shared secret	A string of characters used as a password
cXML punchout request extrinsics	<Extrinsic name="UserEmail"> <a href="mailto:xyz@yourbusiness.com">xyz@yourbusiness.com</a> </Extrinsic>
Authentication Certificate	N/A
Amazon submission URL for PO	An Amazon-established url
HTTPs Basic Authentication User ID/Password, if any.	Username: Your company Password: A string of characters used as a password
cXML From credentials	Your company

cXML To credentials	Amazon
cXML shared secret	A string of characters used as a password
Partner submission URL for PO/shipment confirmation	Business partner provides
HTTP authentication user ID/Password, if any.	Business partner provides

## Integration Process

An administrator initiates integration through self-service in the management pages. Emails are also used to communicate key information and inform participants.

Image 1.4 Integration process steps and descriptions

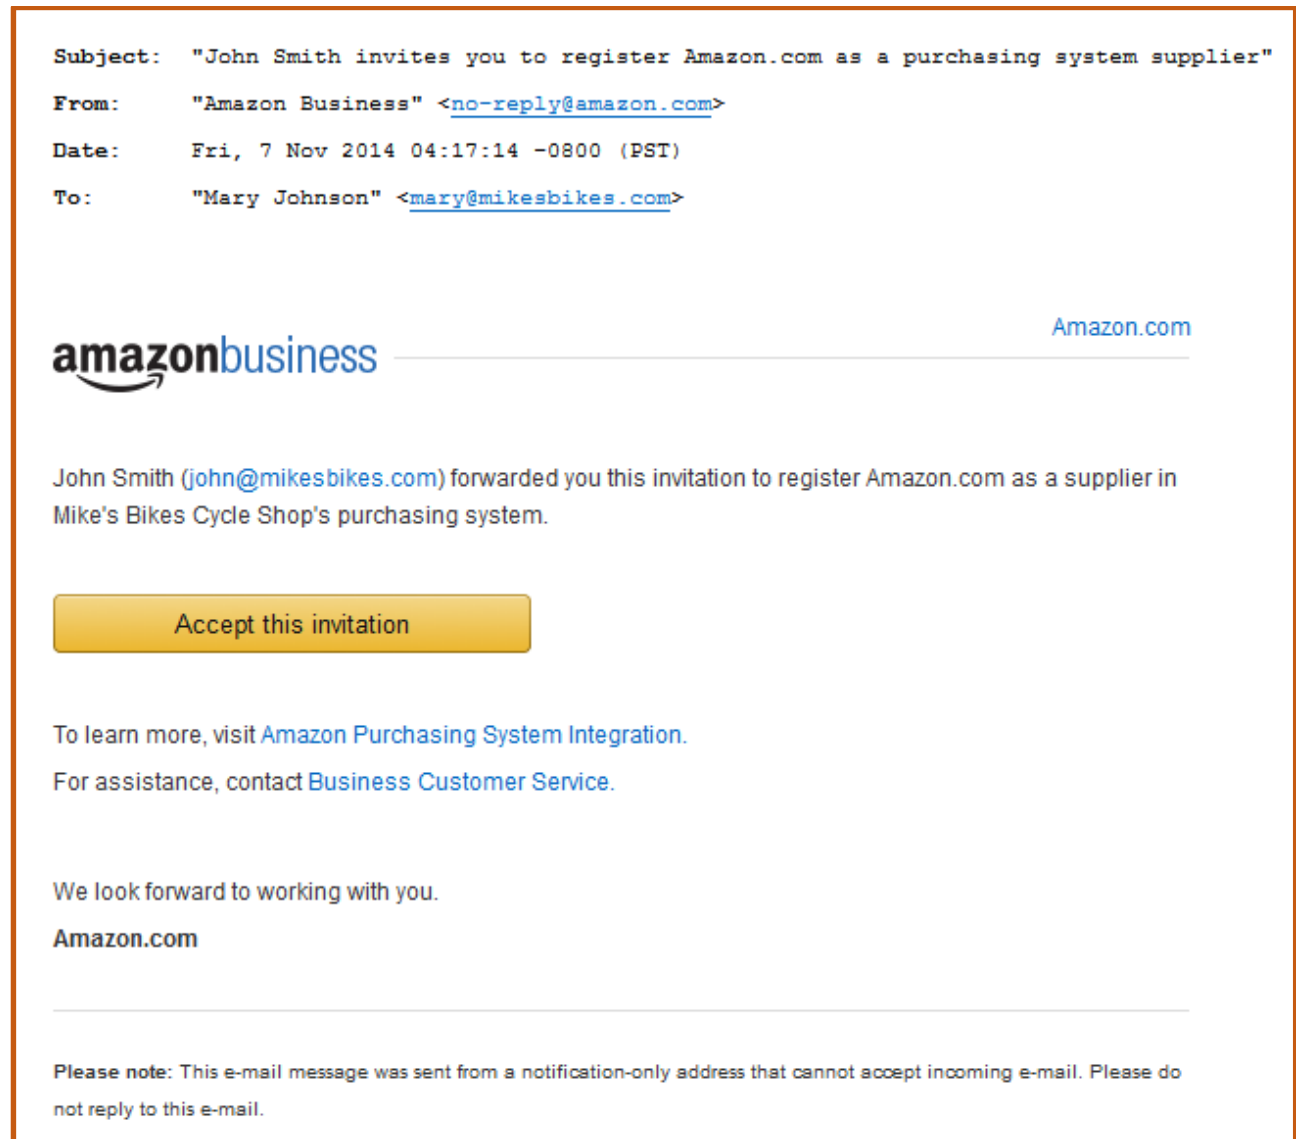

Step	Description
Business registration (creation) and verification	To register your business, create a business account which will be automatically directed to verification.
Self-service punchout implementation	In the business accounts management console, configure the cXML-based credentials for your business and add it to your purchasing environment.
Integration testing (test mode)	Test connectivity, messages, and business logic.
Production release (active mode)	After you complete testing, edit your business settings to active mode.
Post launch	Manage your account, as needed.

## Email Examples

The person you invited receives this email prompting them to register their purchasing system, so that Amazon is added as a supplier in their system.

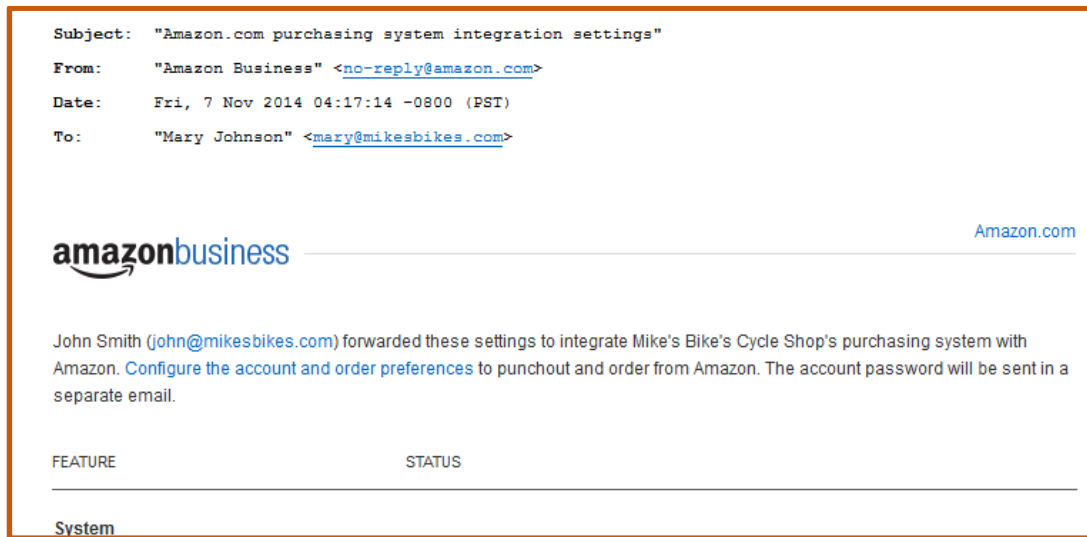

Image 1.5 An invitation to purchasing system to register Amazon as a supplier

The person you sent the configuration settings to receives two emails. The emails can be used by the Technical Administrator to connect with Amazon and integrate the purchasing system.

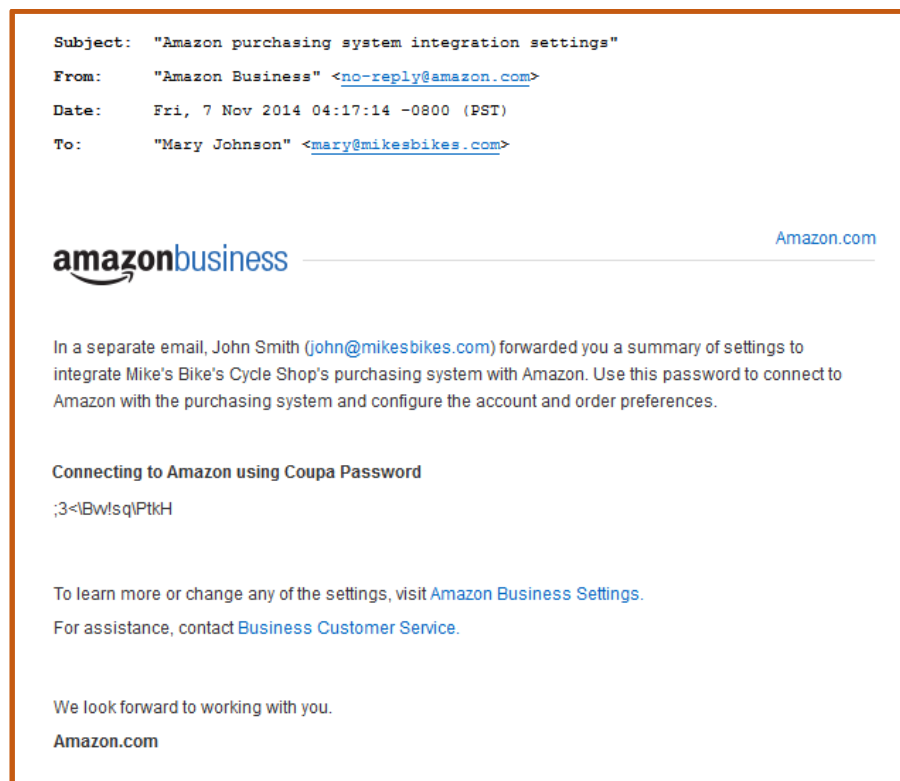

### Example-1a- the first of 2 emails

Image 1.6 An email that has settings to configure the account order preferences

### Example 1b- the second of two emails

Image 1.7 An email that has account password to configure the account order preferences

## Message Formats

Amazon supports these standard cXML document messages:

- PunchoutSetupRequest
- PunchoutSetupResponse
- PunchoutOrderMessage
- OrderRequest
- OrderConfirmation
- ShipmentConfirmation

### Punchout Setup Request (from Purchasing System)

The punchout setup request message is sent to Amazon from the purchasing system when the user punches out to Amazon. The user email ID is required in the **PunchOutSetupRequest** cXML in Extrinsic fields, or Ship To Email Field, or Contact Email for validation purposes.

Important Information:

#### 1. POSR cXML

The user email ID is required in the **PunchOutSetupRequest** cXML in Extrinsic, or Ship To Email, or Contact Email fields for validation purposes. For example:

```
<Extrinsic name="UserEmail">christopher.ask@invalidemail.com.com</Extrinsic>
<Extrinsic name="Email">Christopher.askme@someemailnotvalid.com</Extrinsic>
Ship To Tag <Email> Christopher.askme@someinvalidemail.com </Email>
<contact><email>receiveremail@someinvalidemail.com</email></contact>
```

The business group name is required if the organization has multiple groups created under the business. The business group name identifies which group the punchout user belongs to.

If the organization creates more than one group, pass the group name information. If you don't pass the group name information, the account will default to the root group.

```
<Extrinsic name="UserBusinessUnit">Corporate</Extrinsic>
```

#### 2. OrderRequest cXML

Supplier Part ID and Supplier Part Auxiliary ID are sent on the **PunchOutOrderMessage**. Once the order is confirmed, would be required back on the PurchaseOrder cXML. For example:

```
<SupplierPartID>B00GRACUXM</SupplierPartID>  
<SupplierPartAuxiliaryID>2793745580059, 1 </SupplierPartAuxiliaryID>
```

3. Email order confirmations are sent to the Requester and Payer on the Order.
4. Preferred payment methods are Pcards, individual payment method cards, and line of credit.
5. TPM Contact: [Business Customer Service](#).

For cXML data definitions, please visit [cXML.org](http://cXML.org).

## Code Examples

### Example: Punchout Setup Request

You can pass email in one of three ways: PunchoutSetupRequest, PunchoutOrderMessage, and OrderRequest. The group name is optional, depending upon whether or not the business account will have multiple groups.

```

</Request>
</cXML>

```

## Punchout Setup Response

Punchout Setup Response cXML is sent to the purchasing system from Amazon with a response to the setup request. It indicates whether the request was successful, or not.

For cXML data definitions, please visit [cXML.org](http://cXML.org).

Image 1.8: Codes that may be used by Amazon to respond

Status	Text	Meaning
200	OK	The server was able to execute the request
400	Bad Request	Request unacceptable to the server, although it parsed correctly
401	Unauthorized	Credentials provided in the Request (the Sender element) were not recognized by the server
500	Internal Server Error	Server was unable to complete the request

### Example: PunchoutSetupResponse cXML

```
<cXML>
  <Response>
    <Status code="200"/>
    <PunchOutSetupResponse>
      <StartPage>

      </StartPage>
    </PunchOutSetupResponse>
  </Response>
</cXML>
```

## Punchout Order Message

The Punchout Order Message is sent from Amazon to the purchasing system once the user has selected the items in the cart and submits cart for approval.

For cXML data definitions, please visit [cXML.org](http://cXML.org).

### Example: PunchoutOrderMessage cXML

```

</ItemIn>
</PunchOutOrderMessage>
</Message>
</cXML>

```

## Order Request

The customer purchasing system sends the OrderRequest message to Amazon, specifying the desired purchase details, including items and quantity, along with shipping information. Supplier Item ID and Supplier Part Auxiliary ID are required in the Order Request message. Supplier Part ID and Supplier Part Auxiliary ID are sent on the **PunchOutOrderMessage**. Once the order is confirmed in the purchasing system, these values are required back on the Order Request cXML.

For example:

```

<SupplierPartID>B00GRACUXM</SupplierPartID> <SupplierPartAuxiliaryID>2793745580059, 1
</SupplierPartAuxiliaryID>

```

An Order Request cXML is sent by the purchasing system to Amazon. The transmission methods accepted by Amazon are: HTTPs via basic authentication, or certificate based authentication. For cXML data definitions, please visit [cXML.org](http://cXML.org).

### Example: Order Request

</OrderRequest>
</Request>
</cXML>

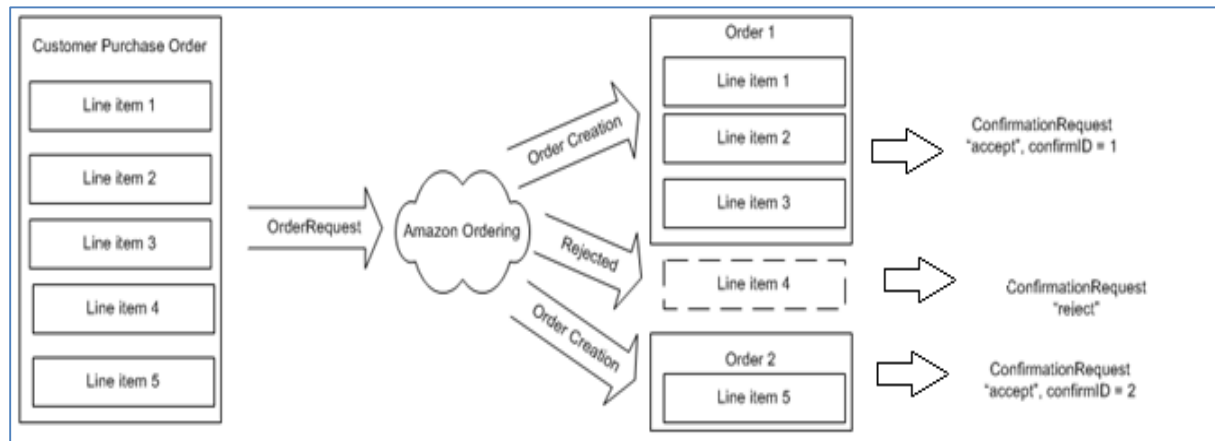

```

## Order Confirmation

The order confirmation request is sent from the Amazon system to the purchasing system, after the order has been processed by Amazon's ordering system. The request will contain the status of the order and whether it has been successfully created. The customer purchase order may be broken into several Amazon orders in cases when, for example, an order is fulfilled by multiple merchants. The Amazon purchasing system will send separate confirmation requests for all approved and rejected items.

An order confirmation is sent via email to buyer and payer for the Business. A cXML based Order Confirmation can also be sent to the purchasing system.

### Image 1.7 Order confirmation

The purchasing system may choose to receive the order confirmation message in a similar manner to the `PunchoutSetupResponse` message. This is optional and will not be acknowledged by Amazon's purchasing system. For cXML data definitions, please visit [cXML.org](http://cxml.org).

## Example: Order Confirmation cXML

## Shipment Confirmation- optional

The ShipmentConfirmation notice will be sent when any part of an order has been shipped. The purchasing system may choose to respond to the ShipmentConfirmation message in a similar manner to the PunchoutSetupResponse message. The shipment confirmation notice is optional and will not be acknowledged by Amazon's purchasing system.

For cXML data definitions, please visit [cXML.org](http://cXML.org).

The OrderResponse acknowledges receipt of the order message. It does not confirm that the order is being placed. It only confirms the receipt of the order, and returns a result code back to the purchasing system. The OrderResponse is sent synchronously to the purchasing system in response to the OrderRequest message. The customer's order ID is not specified, since the response corresponds to the request sent on the same connection.

## Example: Optional Shipment Confirmation cXML

```

<?xml version="1.0" encoding="UTF-8"?>

```

Note: Additional technical information is provided in the technical FAQ section below.

# Technical Administration FAQ

## Message Formats

### Which cXML standard documents does Amazon support?

Amazon supports:

- PunchoutSetupRequest
- PunchoutSetupResponse
- PunchoutOrderMessage
- OrderRequest
- OrderConfirmation
- ShipmentConfirmation

### Do you support single sign on?

No. Single sign on is not currently supported. You cannot sign in directly from your application.

### Is the Amazon system enabled for EDI purchase order (PO) transmission?

No. Amazon supports cXML and OAG transactions for PO transmission. For a specific request for different language support, please contact [Business Customer Service](#).

### Do you support HTTPs without any authentication for Order Request?

No. We support basic HTTP authentication and certificate based authentication for receiving Order Request cXML messages. Use your cXML credentials for basic authentication.

### Can I open Amazon PunchOut in an iFrame?

No. Amazon PunchOut can currently open only in a new window.

### Do you have a different test environment and test credentials we can use?

Amazon's test and production cXML credentials are the same.

### Do you support level 2 punchout?

Level 2 punchout is not currently supported. Please contact [Business Customer Service](#).

### Do you support UNSPSC code and UOM code?

Yes. UNSPSC and UOM are supported and sent to your purchasing system via the Punchout Order cXML message.

**Can you send me list of all UNSPSC code you support?**

Yes. Please contact [Business Customer Service](#).

**Do you support ANSI X12 and OAG transactions for purchase ordering?**

Yes. We support many standard XML transactions for purchase orders.

**Do you support line-level ShipTos?**

Yes. Line-level ShipTos on Order Request cXML are supported.

**How can I filter Amazon products from third-party sellers?**

Amazon provides the Sold By and Fulfilled By information in the punchout Order Message cXML, which can be used by your purchasing system to filter any specific sellers.

**What kind of tolerances can you support at cart selection level and at order level?**

Amazon punchout allows customers to setup the following parameters:

- Delivery Date Range
- Cost Tolerance
- Line Item Subtotal
- Line Item Unit Price
- Back Order Actions
- Line Unavailability action
- Limited Quantity action

**How can I set up shipping addresses, payment information, and cost tolerance for orders?**

- The Shipping Address provided in the Order Request cXML is used as the ShipTo address for the Orders.
- The payment method is configured by Administrators in the Business Accounts. It is applied for all the orders for an Organization.
- Tolerance can be modified either via self-service or by contacting [Business Customer Service](#).

## **How can I setup punchout for multiple business units or groups?**

If your business has multiple people and would benefit from having people organized into groups (such as locations, divisions, or categories), an administrator can create multiple business groups within PunchOut to support workflows.

In this case, the name of the business group should come in as part of the cXML Punchout Setup Request Extrinsic. For example: <Extrinsic name="UserBusinessUnit">business group name</Extrinsic>

## **How can you transmit the reconciliation report?**

To download the reconciliation report:

1. Go to Amazon and sign in.
2. Select Orders.
3. Select Download an order history report.
4. Enter information and select Request Report

## **Can I send the payment method information on the cXML PO?**

For security reasons, Amazon does not accept payment method information on Order Request cXML.

At the time of shipment, the payment method on file for the business is charged.

## **Can I send the GL code, cost center, or project code in the cXML PO?**

No. This is currently not supported. Please contact Amazon Customer Integrations team for your specific support needs.

## **How do I set up shipping addresses, payment information, and cost tolerance for orders?**

- Shipping Address provided in the Order Request cXML is used as the ShipTo address for the Orders.
- Payment method configured in the settings is applied for all the orders for an organization.
- Tolerance can be set via self-service. To get help, contact [Business Customer Service](#).

## **How can buyers with existing Amazon business accounts use Amazon Punchout?**

If you have an existing Amazon business account, you have the option to migrate to Amazon Punchout instead. Please note that you cannot yet use both programs simultaneously.

### **How long does integration take?**

After the technical administrator has successfully integrated, there are no additional steps. The credentials are generated during self-service integration. Technical administrators use those credentials to punchout to Amazon.

### **What do I do with the credentials that Amazon generated?**

An administrator works with their technical administrator, such as a technical program manager, to connect to Amazon from the purchasing system.

The [From](#) and [To](#) credentials can be entered in your purchasing system so that the Punchout transactions can be validated.

### **What specific details do I need to send in punchout cXML to Amazon?**

Please review the Technical Administration section.

### **How do I test? How do I go to production?**

Test mode is auto-enabled after registration. You are ready to test once you have generated your credentials and populated in your purchasing system. You can decide when you have successfully completed testing and are ready to move the credentials to active (production) mode.

### **How do punchout users get added to your system?**

Users who can requisition a purchase order on behalf of an organization are added when they Punchout to Amazon for the first time.

An Administrator can also add users on Amazon.com. Go to Your Account, and select [Manage Your Business](#) under the Settings section.

### **Will I have an ongoing test environment?**

Yes. You can edit your system back to test mode after you have edited it to Active status.

## **Providing Feedback**

## How can I provide feedback, including suggestions for product improvement?

If you have a suggestion to improve your experience shopping for business supplies, or if there is something you'd like to be able to do that you can't, we'd like to hear from you. Please send feedback to [Business Customer Service](#). Let us know your:

- name
- suggestion(s)
- contact information

## How can I provide suggestions for help topics to include on this page?

Please let us know if you have a suggestion for an additional help topic that would help your purchasing experience? Contact [Business Customer Service](#).

**Thank you. We value your input.**

# Business Customer Service

## How can I contact business customer service?

To contact [Business Customer Service](#) for assistance with any issues or inquiries:

1. Sign in to your business account.
2. Select [Help](#) from the link on the header of the landing page.
3. Select the Contact Customer Service for [Business Customer Service](#) link, where you will be able to choose phone, email and chat options.

After you have selected your contact option, and provided the required account security information, [Business Customer Service](#) will be able to provide information.

## What information do I need to provide when I call business customer service?

Please provide your business name and email address, or an order ID number.

## What are Business Customer Service team hours?

The Amazon Business Customer Service team is available M-F, from 8 to 10 EST, and Sat. & Sun. from 8 to 5 EST. For account security, you must provide identification information.
